

## for Loop in C

Loops programming construct is used to execute one or more instructions repeatedly until some condition is satisfied.

3 types of loops exist:

### for LOOP

for loop also known as **Iteration**. Iteration logic is used when one or more instructions may be executed several times depending on some condition.

### ITERATION

- Iteration comes from the word “reiterate”, which means to repeat
- Iteration is a looping construct
- Iteration is a combination of decision and sequence and can repeat steps
- Iteration can be thought of as “while something is true, do this, otherwise stop”

### for loop syntax

```
for (initialization; condition; increment or decrement)
{
    .....
    .....
    .....
    .....
    .....
}
← program statements
```

The statements inside for loop gets executed until the condition become **FALSE**.

For loop also known as **iterative** statement. **To iterate means to repeat**. If we want to repeat execution of some action or statements several times, we use LOOPS.

### Practice Programs

```
(i)
#include<stdio.h>
void main()
{
    int x;

    for(x = 0; x<5; x++)
    printf("Stephen Hawking\n");
}
```

```
(ii)
#include<stdio.h>
void main()
{
    system("color fc");

    int x;
    for(x = 0; x<5; x++)
    printf("Stephen Hawking\n");
}
```

```
(iii)
#include<stdio.h>
void main()
{
    int x, y;

    for(x = 1; y = 5; x++)
    printf("Stephen Hawking\n");
}
```

```
(iv)
#include<stdio.h>
void main()
{
    int x, y = 10;

    for(x = 2; y == 10; x++)
    printf("Stephen Hawking\n");
}
```

```
(v)
#include<stdio.h>
void main()
{
    int i, x, y;
    x = 2;
    y = 3;

    for(i = 2; x+y; i++)
    printf("Stephen Hawking\n");
}
```

```
(vi)
#include<stdio.h>
void main()
{
    int i, x, y;
    x = 2;
    y = 3;

    for(i = 2; (x+y)>0; i++)
    printf("Stephen Hawking\n");
}
```

```
(vii)
#include<stdio.h>
void main()
{
    int i, x, y;
    x = 2;
    y = 3;

    for(i = 2; (x+y)<0; i++)
        printf("Stephen Hawking\n");
}
```

```
(viii)
#include<stdio.h>
void main()
{
    int i;

    for(i = 2; i<=5; i++)
    {
        printf("Stephen Hawking\n");
        printf("Galaxy\n");
    }
}
```

```
(ix)
#include<stdio.h>
void main()
{
    int i, x, y;

    for(i = 2; i<=5; i++)

        printf("Stephen Hawking\n");
        printf("Cosmologist\n");
        printf("Galaxy\n");
}
```

```
(x)
#include<stdio.h>
void main()
{
    int i, x, y;

    for(i = 2; i<=5; i++)
    {
        printf("Stephen Hawking\n");
        printf("Cosmologist\n");
        printf("Galaxy\n");
    }
}
```

## Program explanation

### Program 1

```
#include<stdio.h>
int main()
{
    int x;

    for(x = 0; x<5; x++)
        printf("Stephen Hawking\n");

    return 0;
}
```

```
for(x = 0; x<5; x++)
    cout<<"Stephen Hawking"<<endl;
```

Value of x	Condition x<5	Output
0	0<5 True	Stephen Hawking
1	1<5 True	Stephen Hawking
2	2<5 True	Stephen Hawking
3	3<5 True	Stephen Hawking
4	4<5 True	Stephen Hawking
5	5<5 False	<ul style="list-style-type: none"> <li>• Loop stops here as conditions becomes false</li> <li>• For loop come out of loop when condition becomes false</li> <li>• As long as condition is true, the statements inside for loop gets executed</li> </ul>

## Program 2

```
#include<stdio.h>
```

```
int main()
{
    system("color fc");

    int x;

    for(x = 0; x<5; x++)
        printf("Stephen Hawking\n");

    return 0;
}
```

Used to change **output window** background color and text color

system ("color xx");  
xx can any of following 2 letters

0	Black	4	Red	8	Gray	C	Light Red
1	Blue	5	Purple	9	Light Blue	D	Light Purple
2	Green	6	Yellow	A	Light Green	E	Light Yellow
3	Aqua	7	White	B	Light Aqua	F	Bright White

## Program 3

```
#include<stdio.h>
```

```
int main()
{
    int x, y;

    for(x = 1; y = 5; x++)
        printf("Stephen Hawking\n");

    return 0;
}
```

for(x=1; y=5; x++)  
initial value of x = 1  
y = 5 is condition  
5 is put into y and 5 is non-zero. So, the condition is always true.  
So gives infinite loop

## Program 4

```
#include<stdio.h>
```

```
int main()
{
    int x, y = 10;

    for(x = 2; y == 10; x++)
        printf("Stephen Hawking\n");

    return 0;
}
```

int x, y=10;

for(x=2; y == 10; x++)

10 == 10 → after comparing LHS & RHS, this statement returns **TRUE**

So, the statement following for loop gets executed **infinitely** (∞)

## Program 5

```
#include<stdio.h>

int main()
{
    int i, x, y;
    x = 2;
    y = 3;

    for(i = 2; x+y; i++)
        printf("Stephen Hawking\n");

    return 0;
}
```

$x = 2;$   
 $y = 3;$   
**for(i=2; x+y; i++)**  
condition  $x+y = 2+3 = 5$  is always true  
So, this is infinite loop

## Program 6

```
#include<stdio.h>

int main()
{
    int i, x, y;
    x = 2;
    y = 3;

    for(i = 2; (x+y)>0; i++)
        printf("Stephen Hawking\n");

    return 0;
}
```

**for(i=2; (x+y)>0; i++)**  
Condition  $(x+y) > 0$   
 $(2+3) > 0 \rightarrow 5 > 0$  is always true.  
So, this is also example of **infinite ( $\infty$ )** loop

## Program 7

```
#include<stdio.h>

int main()
{
    int i, x, y;
    x = 2;
    y = 3;

    for(i = 2; (x+y)<0; i++)
        printf("Stephen Hawking\n");

    return 0;
}
```

**for(i=2; (x+y)<0; i++)**  
Condition  $(x+y) > 0$   
 $(2+3) < 0 \rightarrow 5 < 0$  is FALSE.  
So, there is **no output**

## Program 8

```
#include<stdio.h>

int main()
{
    int i;

    for(i = 2; i<=5; i++)
    {
        printf("Stephen Hawking\n");
        printf("Galaxy\n");
    }
    return 0;
}
```

```
for(i = 2; i<=5; i++)
{
    cout<<"Stephen Hawking"<<endl;
    cout<<"Galaxy"<<endl;
}
```

Value of i	Condition i<=5	Output
2	2<=5 True	Stephen Hawking Galaxy
3	3<=5 True	Stephen Hawking Galaxy
4	4<=5 True	Stephen Hawking Galaxy
5	5<=5 True	Stephen Hawking Galaxy
6	6<=5 False	<ul style="list-style-type: none"><li>• Loop stops here as conditions becomes false</li><li>• for comes out of loop when condition becomes false</li><li>• As long as condition is true, the statements inside for loop gets executed</li></ul>

## Program 9

```
#include<stdio.h>

int main()
{
    int i, x, y;

    for(i = 2; i<=5; i++)

        printf("Stephen Hawking\n");
        printf("Cosmologist\n");
        printf("Galaxy\n");

    return 0;
}
```

This example explains absence of braces {}  
The first statement below for loop runs 4 times  
and the loop stops. Then for goes out of the loop  
and prints next 2 statements

## Program 10

```
#include<stdio.h>

int main()
{
    int i, x, y;

    for(i = 2; i<=5; i++)
    {
        printf("Stephen Hawking\n");
        printf("Cosmologist\n");
        printf("Galaxy\n");
    }

    return 0;
}
```

if we put braces, all 3 statements get executed 4 times
